- ▶ sorting challenges
- ▶ shellsort

# Sorting problem

Ex. Student record in a university.

file →

record →

key →

Fox	1	A	243-456-9091	101 Brown
Quilici	1	C	343-987-5642	32 McCosh
Chen	2	A	884-232-5341	11 Dickinson
Furia	3	A	766-093-9873	22 Brown
Kanaga	3	B	898-122-9643	343 Forbes
Andrews	3	A	874-088-1212	121 Whitman
Rohde	3	A	232-343-5555	115 Holder
Battle	4	C	991-878-4944	308 Blair
Aaron	4	A	664-480-0023	097 Little
Gazsi	4	B	665-303-0266	113 Walker

Sort. Rearrange array of  $N$  objects into ascending order.

Aaron	4	A	664-480-0023	097 Little
Andrews	3	A	874-088-1212	121 Whitman
Battle	4	C	991-878-4944	308 Blair

Rohde	3	A	232-343-5555	115 Holder
Quilici	1	C	343-987-5642	32 McCosh

# Sample sort client

Goal. Sort **any** type of data.

Ex 1. Sort random numbers in ascending order.

```
public class Experiment
{
    public static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        Double[] a = new Double[N];
        for (int i = 0; i < N; i++)
            a[i] = StdRandom.uniform();
        Insertion.sort(a);
        for (int i = 0; i < N; i++)
            StdOut.println(a[i]);
    }
}
```

```
% java Experiment 10
0.08614716385210452
0.09054270895414829
0.10708746304898642
0.21166190071646818
0.363292849257276
0.460954145685913
0.5340026311350087
0.7216129793703496
0.9003500354411443
0.9293994908845686
```

## Sample sort client

Goal. Sort **any** type of data.

Ex 2. Sort strings from standard input in alphabetical order.

```
public class StringSorter
{
    public static void main(String[] args)
    {
        String[] a = StdIn.readAll().split("\\s+");
        Insertion.sort(a);
        for (int i = 0; i < a.length; i++)
            StdOut.println(a[i]);
    }
}
```

```
% more words3.txt
bed bug dad yet zoo ... all bad yes

% java StringSorter < words.txt
all bad bed bug dad ... yes yet zoo
```

Goal. Sort **any** type of data.

Q. How can `sort()` know to compare data of type `String`, `Double`, and `File` without any information about the type of a key?

Callbacks = reference to executable code.

- Client passes array of objects to `sort()` function.
- The `sort()` function calls back object's `compareTo()` method as needed.

Implementing callbacks.

- Java: **interfaces**.
- C: function pointers.
- C++: class-type functors.
- C#: delegates.
- Python, Perl, ML, Javascript: first-class functions.

# Callbacks: roadmap

## client

```
import java.io.File;
public class FileSorter
{
    public static void main(String[] args)
    {
        File directory = new File(args[0]);
        File[] files = directory.listFiles();
        Insertion.sort(files);
        for (int i = 0; i < files.length; i++)
            StdOut.println(files[i].getName());
    }
}
```

## object implementation

```
public class File
implements Comparable<File>
{
    ...
    public int compareTo(File b)
    {
        ...
        return -1;
        ...
        return +1;
        ...
        return 0;
    }
}
```

## Comparable interface (built in to Java)

```
public interface Comparable<Item>
{
    public int compareTo(Item that);
}
```

key point: no reference to `File`

## sort implementation

```
public static void sort(Comparable[] a)
{
    int N = a.length;
    for (int i = 0; i < N; i++)
        for (int j = i; j > 0; j--)
            if (a[j].compareTo(a[j-1]) < 0)
                
                exch(a, j, j-1);
            else break;
}
```

# Comparable API

Implement `compareTo()` so that `v.compareTo(w)`:

- Returns a negative integer if `v` is less than `w`.
- Returns a positive integer if `v` is greater than `w`.
- Returns zero if `v` is equal to `w`.
- Throw an exception if incompatible types or either is `null`.

```
public interface Comparable<Item>
{   public int compareTo(Item that); }
```

**Required properties.** Must ensure a **total order**.

- Reflexive:  $(v = v)$ .
- Antisymmetric: if  $(v < w)$  then  $(w > v)$ ; if  $(v = w)$  then  $(w = v)$ .
- Transitive: if  $(v \leq w)$  and  $(w \leq x)$  then  $(v \leq x)$ .

**Built-in comparable types.** `String`, `Double`, `Integer`, `Date`, `File`, ...

**User-defined comparable types.** Implement the `Comparable` interface.

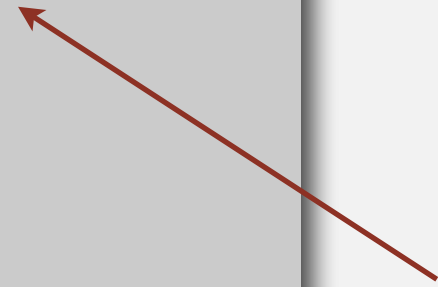

# Implementing the Comparable interface: example

Date data type. Simplified version of java.util.Date.

```
public class Date implements Comparable<Date>
{
    private final int month, day, year;

    public Date(int m, int d, int y)
    {
        month = m;
        day    = d;
        year   = y;
    }
}
```

```
    public int compareTo(Date that)
    {
        if (this.year < that.year ) return -1;
        if (this.year > that.year ) return +1;
        if (this.month < that.month) return -1;
        if (this.month > that.month) return +1;
        if (this.day < that.day ) return -1;
        if (this.day > that.day ) return +1;
        return 0;
    }
}
```

only compare dates  
to other dates

## Two useful sorting abstractions

**Helper functions.** Refer to data through compares and exchanges.

**Less.** Is object  $v$  less than  $w$ ?

```
private static boolean less(Comparable v, Comparable w)
{   return v.compareTo(w) < 0;   }
```

**Exchange.** Swap object in array  $a[]$  at index  $i$  with the one at index  $j$ .

```
private static void exch(Comparable[] a, int i, int j)
{
    Comparable swap = a[i];
    a[i] = a[j];
    a[j] = swap;
}
```

Q. How to test if an array is sorted?

```
private static boolean isSorted(Comparable[] a)
{
    for (int i = 1; i < a.length; i++)
        if (less(a[i], a[i-1])) return false;
    return true;
}
```

Q. If the sorting algorithm passes the test, did it correctly sort its input?

Q. How to test if an array is sorted?

```
private static boolean isSorted(Comparable[] a)
{
    for (int i = 1; i < a.length; i++)
        if (less(a[i], a[i-1])) return false;
    return true;
}
```

Q. If the sorting algorithm passes the test, did it correctly sort its input?

A. Yes, if data accessed only through `exch()` and `less()`.

- ▶ rules of the game
- ▶ **selection sort**
- ▶ insertion sort
- ▶ sorting challenges
- ▶ shellsort

# Selection sort

Algorithm. ↑ scans from left to right.

Invariants.

- Elements to the left of ↑ (including ↑) fixed and in ascending order.
- No element to right of ↑ is smaller than any element to its left.

# Selection sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.

```
i++;
```

- Identify index of minimum item on right.

```
int min = i;  
for (int j = i+1; j < N; j++)  
    if (less(a[j], a[min]))  
        min = j;
```

- Exchange into position.

```
exch(a, i, min);
```

## Selection sort: Java implementation

```
public class Selection
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
        {
            int min = i;
            for (int j = i+1; j < N; j++)
                if (less(a[j], a[min]))
                    min = j;
            exch(a, i, min);
        }
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }

    private static void exch(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

# Selection sort: mathematical analysis

**Proposition.** Selection sort uses  $(N-1) + (N-2) + \dots + 1 + 0 \sim N^2/2$  compares and  $N$  exchanges.

		a[]

		A	E	E	L	M	O	P	R	S	T	X

Trace of selection sort (array contents just after each exchange)

Running time insensitive to input. Quadratic time, even if input array is sorted.  
Data movement is minimal. Linear number of exchanges.

▶ rules of the game

▶ selection sort

▶ **insertion sort**

▶ sorting challenges

▶ shellsort

# Insertion sort

Algorithm. ↑ scans from left to right.

Invariants.

- Elements to the left of ↑ (including ↑) are in ascending order.
- Elements to the right of ↑ have not yet been seen.

# Insertion sort inner loop

To maintain algorithm invariants:

- Move the pointer to the right.

```
i++;
```

- Moving from right to left, exchange  $a[i]$  with each larger element to its left.

```
for (int j = i; j > 0; j--)  
    if (less(a[j], a[j-1]))  
        exch(a, j, j-1);  
    else break;
```

# Insertion sort: Java implementation

```
public class Insertion
{
    public static void sort(Comparable[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++)
            for (int j = i; j > 0; j--)
                if (less(a[j], a[j-1]))
                    exch(a, j, j-1);
                else break;
    }

    private static boolean less(Comparable v, Comparable w)
    { /* as before */ }

    private static void exch(Comparable[] a, int i, int j)
    { /* as before */ }
}
```

# Insertion sort: mathematical analysis

**Proposition.** To sort a randomly-ordered array with distinct keys, insertion sort uses  $\sim \frac{1}{4} N^2$  compares and  $\sim \frac{1}{4} N^2$  exchanges on average.

**Pf.** Expect each element to move halfway back.

## Insertion sort: best and worst case

**Best case.** If the array is in ascending order, insertion sort makes  $N-1$  compares and 0 exchanges.

A E E L M O P R S T X

**Worst case.** If the array is in descending order (and no duplicates), insertion sort makes  $\sim \frac{1}{2} N^2$  compares and  $\sim \frac{1}{2} N^2$  exchanges.

X T S R P O M L E E A

## Insertion sort: partially-sorted arrays

Def. An **inversion** is a pair of keys that are out of order.

A E E L M O T R X P S

T-R T-P T-S R-P X-P X-S

(6 inversions)

Def. An array is **partially sorted** if the number of inversions is  $O(N)$ .

- Ex 1. A small array appended to a large sorted array.
- Ex 2. An array with only a few elements out of place.

Proposition. For partially-sorted arrays, insertion sort runs in linear time.

Pf. Number of exchanges equals the number of inversions.

number of compares = exchanges +  $(N-1)$

# Diversion: how to shuffle an array

## Knuth shuffle. [Fisher-Yates 1938]

- In iteration  $i$ , pick integer  $r$  between 0 and  $i$  uniformly at random.
- Swap  $a[i]$  and  $a[r]$ .

## Invariants.

- Elements to the left of  $\uparrow$  (including  $\uparrow$ ) are shuffled.
- Elements to the right of  $\uparrow$  have not yet been seen.

**Proposition.** Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.

assuming integers uniformly at random

## Diversion: how to shuffle an array

Knuth shuffle. [Fisher-Yates 1938]

- In iteration  $i$ , pick integer  $r$  between 0 and  $i$  uniformly at random.
- Swap  $a[i]$  and  $a[r]$ .

Invariants.

- Elements to the left of  $\uparrow$  (including  $\uparrow$ ) are shuffled.
- Elements to the right of  $\uparrow$  have not yet been seen.

**Proposition.** Knuth shuffling algorithm produces a uniformly random permutation of the input array in linear time.

assuming integers uniformly at  
random

## Diversion: how to shuffle an array

Knuth shuffle. [Fisher-Yates 1938]

- In iteration  $i$ , pick integer  $r$  between 0 and  $i$  uniformly at random.
- Swap  $a[i]$  and  $a[r]$ .

```
public class StdRandom
{
    ...
    public static void shuffle(Object[] a)
    {
        int N = a.length;
        for (int i = 0; i < N; i++) {
            int r = StdRandom.uniform(1 + i);
            exch(a, i, r);
        }
    }
}
```

← between 0 and  $i$

# Sorting challenge 0

**Input.** Array of doubles.

**Plot.** Data proportional to length.

**Name the sorting method.**

- Insertion sort.
- Selection sort.

# Sorting challenge 1

**Problem.** Sort a file of huge records with tiny keys.

**Ex.** Reorganize your MP3 files.

Which sorting method to use?

- System sort.
- Insertion sort.
- Selection sort.

file →

record →

key →

# Shellsort overview

**Idea.** Move elements more than one position at a time by *h-sorting* the array.

an *h*-sorted array is *h* interleaved sorted subsequences

**Shellsort.** [Shell 1959] *h-sort* the array for decreasing sequence of values of *h*.

input	S	H	E	L	L	S	O	R	T	E	X	A	M	P	L	E
13-sort	P	H	E	L	L	S	O	R	T	E	X	A	M	S	L	E
4-sort	L	E	E	A	M	H	L	E	P	S	O	L	T	S	X	R
1-sort	A	E	E	E	H	L	L	L	M	O	P	R	S	S	T	X

How to *h*-sort an array? Insertion sort, with stride length *h*.

## 3-sorting an array

M	O	L	E	E	X	A	S	P	R	T
E	O	L	M	E	X	A	S	P	R	T
E	E	L	M	O	X	A	S	P	R	T
E	E	L	M	O	X	A	S	P	R	T
A	E	L	E	O	X	M	S	P	R	T
A	E	L	E	O	X	M	S	P	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T
A	E	L	E	O	P	M	S	X	R	T

## Why insertion sort?

- Big increments  $\Rightarrow$  small subarray.
- Small increments  $\Rightarrow$  nearly in order. [stay tuned]

# Shellsort example: increments 7, 3, 1

input

S O R T E X A M P L E

7-sort

S	O	R	T	E	X	A	M	P	L	E
M	O	R	T	E	X	A	S	P	L	E
M	O	R	T	E	X	A	S	P	L	E
M	O	L	T	E	X	A	S	P	R	E
M	O	L	E	E	X	A	S	P	R	T

3-sort

M	O	L	E	E	X	A	S	P	R	T
E	O	L	M	E	X	A	S	P	R	T
E	E	L	M	O	X	A	S	P	R	T

A	E	E	L	O	P	M	S	X	R	T
A	E	E	L	M	O	P	S	X	R	T
A	E	E	L	M	O	P	S	X	R	T
A	E	E	L	M	O	P	R	S	X	T
A	E	E	L	M	O	P	R	S	T	X

result

A E E L M O P R S T X

# Shellsort: intuition

**Proposition.** A  $g$ -sorted array remains  $g$ -sorted after  $h$ -sorting it.

7-sort

<b>M</b>	O	R	T	E	X	A	S	P	L	E
M	O	R	T	E	X	A	S	<b>P</b>	L	E
M	O	<b>L</b>	T	E	X	A	S	P	<b>R</b>	E
M	O	L	<b>E</b>	E	X	A	S	P	R	<b>T</b>
M	O	L	E	E	X	A	S	P	R	T

3-sort

M	O	L	E	E	X	A	S	P	R	T
<b>E</b>	O	L	<b>M</b>	E	X	A	S	P	R	T
E	<b>E</b>	L	M	O	X	A	S	P	R	T
E	E	L	M	O	<b>X</b>	A	S	P	R	T
<b>A</b>	E	L	E	O	X	M	S	P	R	T
A	E	L	E	O	X	M	<b>S</b>	P	R	T
A	E	L	E	O	P	M	S	<b>X</b>	R	T
A	E	L	E	O	P	M	S	X	<b>R</b>	<b>T</b>
A	E	<b>L</b>	E	O	P	M	S	X	<b>R</b>	T

still 7-sorted

**Challenge.** Prove this fact—it's more subtle than you'd think!

## Which increment sequence to use?

Powers of two. 1, 2, 4, 8, 16, 32, ...

No.

Powers of two minus one. 1, 3, 7, 15, 31, 63, ...

Maybe.

→  $3x + 1$ . 1, 4, 13, 40, 121, 364, ...

OK. Easy to compute.

merging of  $(9 \times 4^i) - (9 \times 2^i) + 1$  and  $4^i - (3 \times 2^i) + 1$

Sedgewick. 1, 5, 19, 41, 109, 209, 505, 929, 2161, 3905, ...

Good. Tough to beat in empirical studies.

## Shellsort: analysis

**Proposition.** The worst-case number of compares used by shellsort with the  $3x+1$  increments is  $O(N^{3/2})$ .

**Property.** The number of compares used by shellsort with the  $3x+1$  increments is at most by a small multiple of  $N$  times the # of increments used.

N	compares	$N^{1.289}$	$2.5 N \lg N$
5,000	93	58	106
10,000	209	143	230
20,000	467	349	495
40,000	1022	855	1059
80,000	2266	2089	2257

measured in thousands

**Remark.** Accurate model has not yet been discovered (!)

# Why are we interested in shellsort?

Example of simple idea leading to substantial performance gains.

Useful in practice.

- Fast unless array size is huge.
- Tiny, fixed footprint for code (used in embedded systems).
- Hardware sort prototype.

Simple algorithm, nontrivial performance, interesting questions.

- Asymptotic growth rate?
- Best sequence of increments?  open problem: find a better increment sequence
- Average-case performance?

**Lesson.** Some good algorithms are still waiting discovery.
